DETAILED ACTION

Receipt of Request for Continued Examination, Extension of Time, and Amendment F received on July 14, 2003 is acknowledged. Claims 1-13 are pending in this application.

Response to Arguments

Applicant argues that the instant invention has an increased local effect than normally expected. It is argued that agents have a time period of effect and the "prolonged" time frame is longer than the active. Lastly, unexpectedness is argued.

Applicant's arguments have been fully considered but they are not persuasive. US patent 6,068,860 discloses that the composition allows for an increased amount of a drug penetration at a given site but also the accumulation of an increased amount of drug at the site. Although the applicant argues that this is a different goal, the examiner points out that the duration of a drug's effectiveness is inherently increased if the drug is allowed to accumulate at a site. This accumulation allows for a continued dose at the site, which is in essence is prolonging the effective action of the drug since there is more of the drug to treat the area.

Secondly in regards to the time period, applicant's definition is vague since there are numerous active agents with various windows of activity. Therefore, the prior art still reads on instant invention.

Lastly in regards to the unexpected results in the specification, the results are not a direct comparison with the prior art and are not commensurate in scope.

Claim Rejections - 35 USC § 102

Art Unit: 1616

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

Claims 1-7, 9-11, and 13 are rejected under 35 U.S.C. 102(e) as being anticipated by Carlsson et al (6,068,860).

Carlsson et al disclose a pharmaceutical formulation containing a glucocorticoid, foscarnet, and galactolipids (example 5). The composition provides an anti-inflammatory agent to the skin. See column 4, lines 15-17. The galactolipids are from oats (example 5). The galactolipid material further contains 70-80% digalactosyldiaacylglycerol and 20-30% of other polar lipids. See column 5. The reference teaches the actives dissolved or encapsulated in a liposome containing galactolipids, which penetrates the skin rapidly provides an improved accumulation of foscarnet in the living epidermis, it can sustain a high concentration of the active, and is chemically and physically stable (col. 4, lines 10-25 and col. 10, line 35 to col. 11, lines 60). Further, glycerol is taught. See examples.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Application/Control Number: 09/632,602

Art Unit: 1616

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-9 and 12-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Carlsson et al (5,688,528) in view of Brodin et al (5,912,271).

Carlsson et al teach an oil-in-water emulsion containing galactolipid material as an emulsifer in the amount of 0.1-10% and active agents. The composition may be formulated for topical administration. See column 4, line 35. The galactolipid material consists of about 70-80% digalactosyldiacylgylcerol and 20-30% of other polar lipids. See column 2, lines 42-45. The galactolipid material is prepared from oat kernels. See examples. The composition may contain other conventional excipients such as thickening agents, preservatives, antioxidants, etc. See column 3, lines 48-52 and examples. The preservatives, thickeners, and oils are taught in the instant amounts. See examples. The inclusion of dermatological agents and linoleic acids are taught in column 3, lines 28-67 Glycerol is taught in example 18 with an anaesthetic drug. Lastly, Carlsson teach the galactolipid material affords stability to the formulations.

Carlsson et al do not specify the function of the galactolipid.

Brodin et al teach a topical pharmaceutical preparation for anaesthetic agents. The composition contains the active agent in the amount of 1-40%, a polar lipid (galactolipid) in the amount of 1-10%, triglycerol in the amount of 50-85%, and water. See column 2, lines 11-25. Brodin teaches that the polar lipids, sphingolipids or galactolipids have a dual function of reducing the onset time and extent the duration of the active agent and acting as a dispersing agent and stabilizer in the formulation.

Application/Control Number: 09/632,602

Art Unit: 1616

Brodin results indicate the polar lipids function of prolonging the effect of the active agent. See column 5.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Carlsson et al and Brodin et al and expect the galactolipid formulation of Carlsson's to have a prolonged effect. One would have be motivated to do so since Brodin teaches the functional property of galactolipid to prolong the effectiveness of the active agent. Therefore, although Carlsson does not explicitly disclose this functional property of the galactolipid in the formulation, one would expect this property in Carlsson's formulation since "prolonged effectiveness" is known in the art at the time the invention was made.

Claims 10-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Carlsson et al (5,688,528) in view of Brodin et al (5,912,271), in further view of Cooper et al (4,552,872).

AS set forth above, Carlsson et al teach an oil-in-water emulsion containing galactolipid material as an emulsifer in the amount of 0.1-10% and active agents such as dermatological agents. Brodin et al teach the functional property of galactolipids.

The references do not teach the inclusion of a corticosteroid.

Cooper et al teach a topical composition containing corticosteroid for inflammatory conditions such as atopic dermatitis. See abstract and column 12, lines 13.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of the references and utilize

Application/Control Number: 09/632,602

Art Unit: 1616

Page 6

corticosteroid for the treatment of dermatitis. One would be motivated to do so since Cooper teaches the use of corticosteroids for the treatment of inflammatory conditions such as dermatitis.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Sharmila S. Gollamudi whose telephone number is (703) 305-2147. The examiner can normally be reached on M-F (7:30-4:30).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Thurman Page can be reached on (703) 308-2927. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-0196.
